1. Approval with Runoff

Approval with Runoff
Théo Delemazure, Jérôme Lang, Jean-François Laslier, Remzi Sanver
IJCAI-2022

1st Round: Voters can vote for one candidate among the possible ones.

1st Round: Voters can vote for one candidate among the possible ones.

The **two candidates** with the most votes are selected.

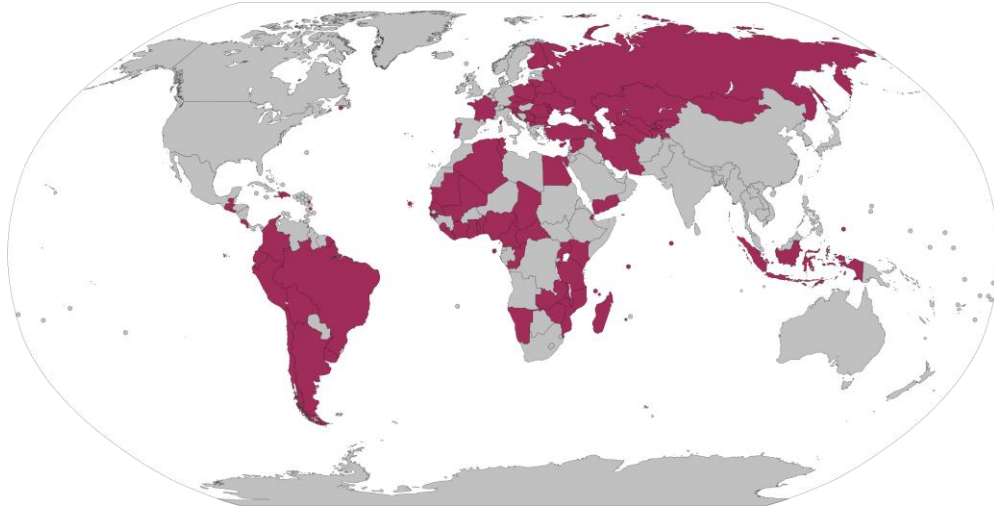

2nd Round: Voters can now only vote for one of the finalists.

2nd Round: Voters can now only vote for one of the finalists.

The candidate with the most votes is the **winner**.

84 countries use it to elect
their head of state

In France, it is used in almost every high-stakes election

Axiom: Independence of clones (*Tideman, 1987*)

Adding a “clone” of a candidate should not change significantly the result of the election.

**Plurality with
Runoff**

2nd Round: Ann & Bob

2nd Round: Ann & Cora

Axiom: Independence of clones (*Tideman, 1987*)

Adding a “clone” of a candidate should not change significantly the result of the election.

**Plurality with
Runoff**

Axiom: Monotonicity (*Fishburn, 1982*)

If some candidate is the winner, and we increase their support, this candidate should still win.

**Plurality with
Runoff**

1st round: Voters can vote for **several candidates** among the possible ones.

Two finalists are selected based on these votes.

2nd round: Same as before.

1st round: Voters can vote for **several candidates** among the possible ones.

Two finalists are selected based on these votes.

2nd round: Same as before.

Question: Which candidates should go to the 2nd round?

We can use **Approval-Based Committee rules** (ABC rules) to select the two finalists:

Rule: Approval Voting (AV)

Rule: Proportional Approval Voting (PAV)

Rule: Chamberlin-Courant Approval Voting (CCAV)

Rule: Sequential-Phragmén

Rule: Eneström-Phragmén

Rule: Split Approval Voting (SAV)

Rule: Approval Voting (AV)

The two finalists are the candidates with the most votes in the first round.

- ✓ **Monotonicity**
- ✗ **Independence of clones**

Rule: Approval Voting (AV)

The two finalists are the candidates with the most votes in the first round.

- ✓ **Monotonicity**
- ✗ **Independence of clones**

Rule: Chamberlin-Courant Approval Voting (CCAV)

The two finalists are the candidates maximizing the number of voters approving at least one of them.

✗ **Monotonicity**

✓ **Independence of clones**

Rule: Chamberlin-Courant Approval Voting (CCAV)

The two finalists are the candidates maximizing the number of voters approving at least one of them.

Monotonicity

**Independence
of clones**

Impossibility Theorem

No neutral approval with runoff rule satisfies both monotonicity and independence of clones.

Axiom: Favorite consistency

The candidate that received the most votes in the first round should be in the second round.

**AV****CCAV**

CCAV selects
Ann and *Cora*
but *Bob* receives
the most votes.

Rule: Sequential CCAV

The **first** finalist is the candidate that received the most votes.

The **second** finalist is the candidate that received the most votes *among voters who did not vote for the first finalist*.

**Favorite consistency****Independence of clones**

	AV	PAV	CCAV	S-PAV	S-CCAV	EnePhr	S-Phr	SAV	TRIV
Pareto-efficiency	✓	✓	✗	✓	✗	✗	✓	✓	✗
strategy-proofness	✓	✗	✓	✗	✗	✗	✗	✗	✓
strong strategy-proofness	✗	✗	✗	✗	✗	✗	✗	✗	✓
monotonicity	✓	✗	✗	✗	✗	✗	✗	✗	✓
weak ind. of clones	✗	✗	✓	✗	✓	✗	✗	✗	✗
approval-efficiency	✓	✗	✗	✓	✓	✓	✓	✗	✗

- 18 of which are political datasets of the ***Voter Autrement*** collection

French presidential elections (since 2002)

Outside polling station, or online

Testing alternative voting methods

Fig. A researcher explaining how to vote with approval voting to a participant of the experiment.

- 1 Approval with runoff rules generally return different finalists than plurality with runoff.
- 2 AV generally selects similar candidates while CCAV selects ideologically distant ones.

Voter Autrement – Grenoble (2017)

 1 069  11

<i>Plurality</i>	LO	NPA	LFI	SOC	EM	LR	DLF	FN
<i>AV</i>	LO	NPA	LFI	SOC	EM	LR	DLF	FN
<i>(Seq-)CCAV</i>	LO	NPA	LFI	SOC	EM	LR	DLF	FN

Approval with runoff has been used in *St. Louis, Missouri* since 2021 for city elections.

Fig. St. Louis, Missouri

“I liked approval”

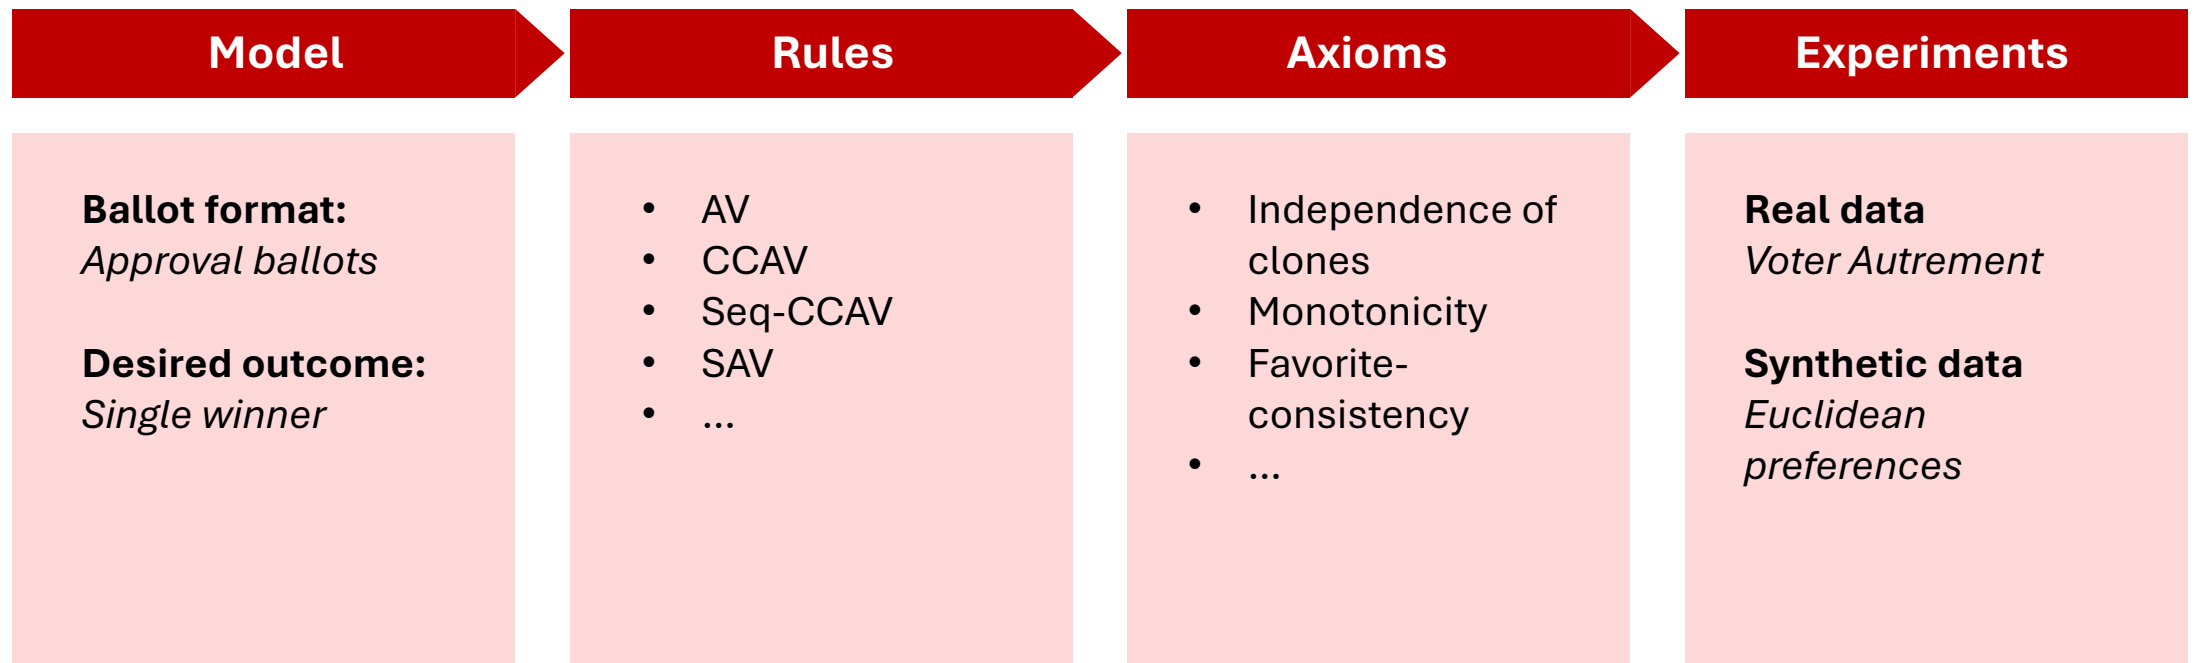

“I liked the expressivity gain”

“The election was more positive”

We use this approach **for all the problems** considered in this thesis

We can enhance plurality with runoff using approval ballots, but there is not a single way to do it.

Let us now see if we can improve another single-winner voting system: *Instant Runoff Voting (IRV)*.

2. Instant Runoff Voting with Indifferences

Generalizing Instant Runoff Voting to Allow Indifferences

Théo Delemazure, Dominik Peters

EC-2024

Voters provide
a **ranking** of the candidates

1	Eddy
2	Dan
3	Bob
4	Ann
5	Cora

We count the number of **first-place**
votes each candidate receives

The candidate with the lowest score is **eliminated**, and their votes are transferred

First characterization of Approval-IRV

Approval-IRV is the **only** runoff scoring rule for weak orders that satisfies **both** independence of clones and respect for cohesive majorities.

Axiom: Monotonicity (*Fishburn, 1982*)

IRV

Axiom: Weak monotonicity

Split-IRV

Approval-IRV

Second characterization of Approval-IRV

Approval-IRV is the **only** runoff scoring rule for weak orders that generalizes IRV and satisfies weak monotonicity.

Euclidean Preferences (Enelow and Hinich, 1984)

»» Positions of voters and candidates are sampled randomly in the space.

Euclidean Preferences (Enelow and Hinich, 1984)

»» Voters prefer candidates that are closer to them:

Euclidean Preferences

(Enelow and Hinich, 1984)

»» We can also obtain weak orders:

Euclidean Preferences (Enelow and Hinich, 1984)

- »» The **cost** of candidates are their average distance to the voters.
- »» The lower the cost, the better.

Which rule returns the candidate **with lowest cost**?
(*proportion over 10 000 instances*)

»» Approval-IRV appears to be a better generalization of IRV to weak orders than Split-IRV.

»» Can expressive ballots also improve the way we vote in *parliamentary elections*?

3. Rankings in Parliamentary Elections with Threshold

Reallocating Wasted Votes in Proportional Parliamentary Elections with Thresholds
Théo Delemazure, Rupert Freeman, Jérôme Lang, Jean-François Laslier, Dominik Peters
EC-2025

Voters vote for one of the parties.

Seats are allocated to the parties **proportionally to their scores**.

Many countries impose an **electoral threshold** to reduce political fragmentation.

- ➡ **Some votes are “lost”:** *D* and *E* supporters have no influence on the seat distribution.
- ➡ This incentivizes forms of **tactical voting**.

2019 election of the French
representative to the EU Parliament.

Threshold

5%

“Lost” votes

20%

2025 election of the *Bundestag*
members.

5%

14%

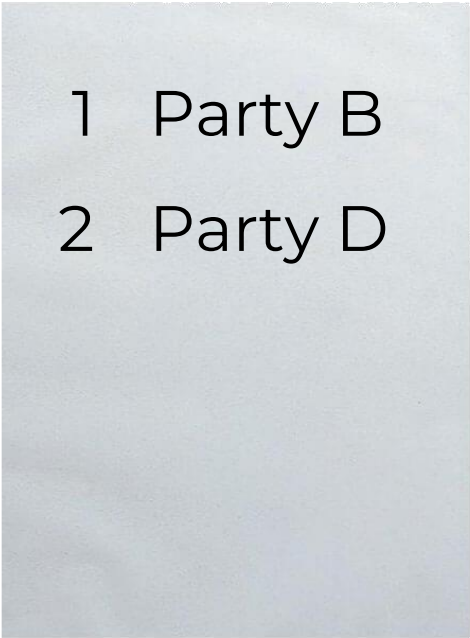

2002 election of the *Turkish*
Parliament members.

10%

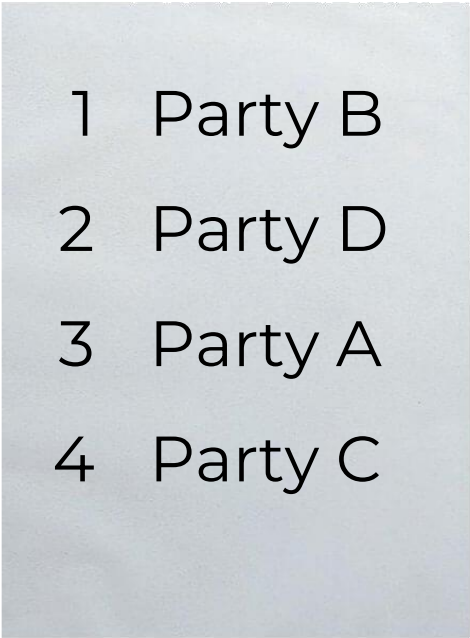

46%

We could ask voters **to vote for two parties**, and we use the second vote only if the first one does not reach the threshold.

1 Party B
2 Party D

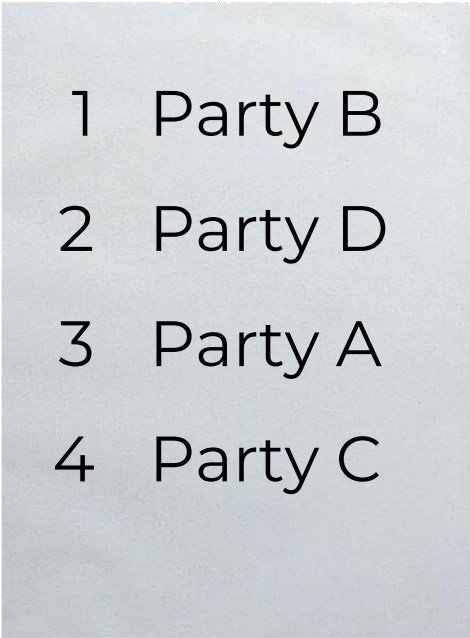

We could ask voters **to vote for two parties**, and we use the second vote only if the first one does not reach the threshold.

1 Party B
2 Party D
3 Party A
4 Party C

We can even ask for a
truncated ranking

We could ask voters **to vote for two parties**, and we use the second vote only if the first one does not reach the threshold.

1 Party B
2 Party D
3 Party A
4 Party C

We can even ask for a
truncated ranking

Question: how to select the parties that are above the threshold?

Rule: Direct Winners Only (DO)

Rule: Single Transferable Vote (STV)

Rule: Greedy Plurality (GP)

Rule: MaxPlurality (MaxP)

Rule: MaxRepresentation (MaxR)

Rule: Direct Winners Only (DO)

The selected parties are all those which receive more first-place votes than required by the threshold.

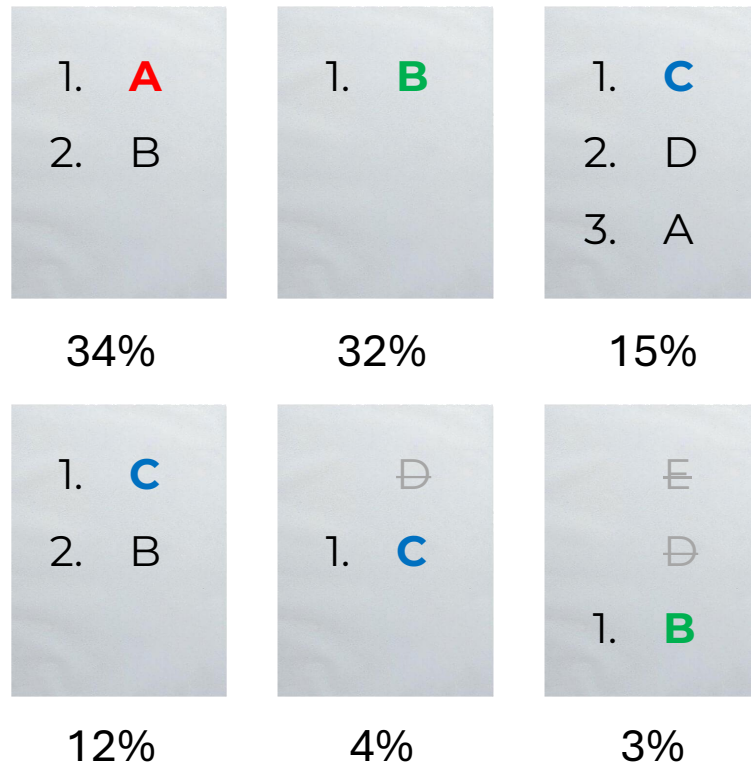

Rule: Direct Winners Only (DO)

The selected parties are all those which receive more first-place votes than required by the threshold.

Rule: Direct Winners Only (DO)

The selected parties are all those which receive more first-place votes than required by the threshold.

Rule: Single Transferable Vote (STV)

Parties that receive the fewest votes are successively eliminated until all parties receive more votes than required by the threshold.

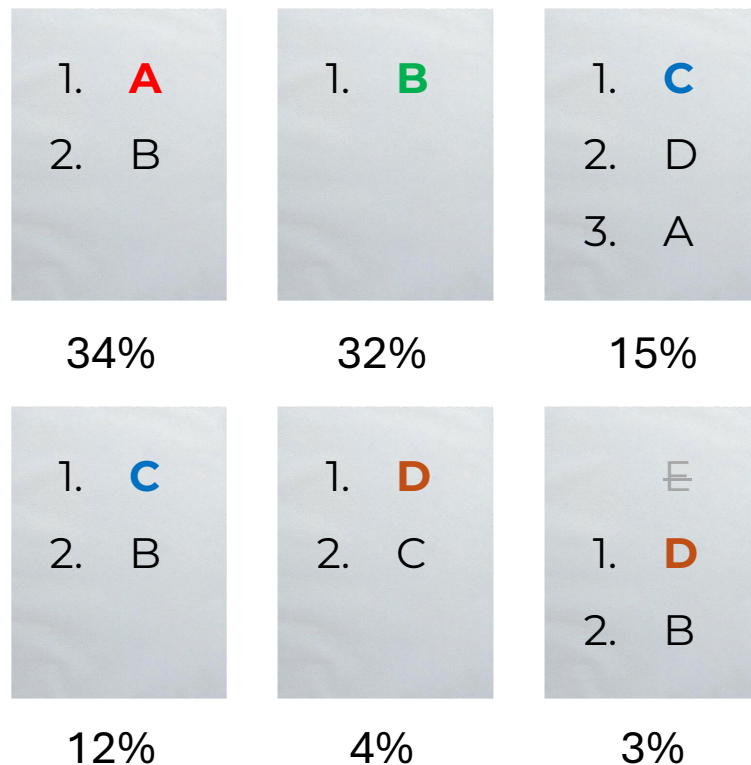

Rule: Single Transferable Vote (STV)

Parties that receive the fewest votes are successively eliminated until all parties receive more votes than required by the threshold.

Rule: Single Transferable Vote (STV)

Parties that receive the fewest votes are successively eliminated until all parties receive more votes than required by the threshold.

Axiom: Representation of solid coalitions

DO

STV

If more voters than required by the threshold all rank a set of parties **S on top of their rankings**, at least one of these parties should be selected.

Fig. Axioms satisfied by the different rules.

- 1 Explanation of the issues caused by the threshold.
- 2 Presentation of the candidate lists.
- 3 **Vote with alternative voting methods.**
- 4 Questionnaire.

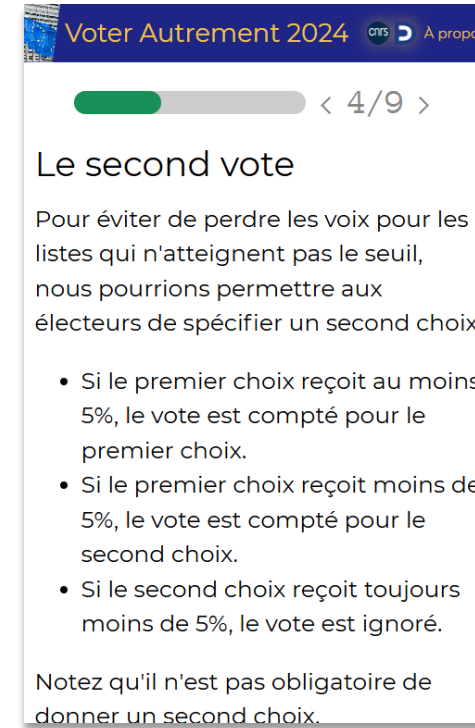

Fig. Screenshot of the website of the experiment conducted during the 2024 election of the French representative to the EU Parliament.

1 *Self-selected* sample

- 3046 participants in a week.
- Recruited through social media.
- Overrepresentation of left-wing, young and educated people.

2 *Representative* sample

- 1000 participants.
- Recruited via a polling institute and paid a fixed amount to participate.
- Representative of the French population.

»» Less votes are “lost” and not taken into account

»» We still reduce the number of lost votes if we impose short rankings

Self-selected sample with the **STV** rule

We can heavily reduce the number of “lost votes” using rankings instead of uninominal votes in parliamentary elections.

Expressive ballots also inform us about the structure of the electorate, and the candidate set.

4. Learning Candidate Axes from Approval Data

Comparing Ways of Obtaining Candidate Orderings from Approval Ballots

Théo Delemazure, Chris Dong, Dominik Peters, Magdalena Tydrichova

IJCAI-2024

Fig. Picture of the seat distribution in the French National Assembly used by the newspaper *Libération* after the 2024 election.

We know voters' **approval ballots**

We want to find an **ordering** of the candidates

Candidate Interval Property (*Elkind & Lackner, 2015*)

Every approval ballot is an “interval” of the axis.

Candidate Interval Property (*Elkind & Lackner, 2015*)

Every approval ballot is an “interval” of the axis.

In real life, there generally is no “*perfect axis*”

Question: how to select the axis that fits the ballots the best?

Rule: Voter Deletion (VD)

Rule: Minimum Flips (MF)

Rule: Ballot Completion (BC) (*Lebon et al, 2017*)

Rule: Minimum Swaps (MS)

Rule: Forbidden Triples (FT)

© Piotr Faliszewski

Axiom: Clone proximity

Clones should be next to each other on the axis (or separated by other clones).

Axiom: Clone proximity

Clones should be next to each other on the axis (or separated by other clones).

Axiom: Independence of clones

If we add clones, the relative order of other candidates should not change.

Axiom: Clone proximity

Clones should be next to each other on the axis (or separated by other clones).

Axiom: Independence of clones

If we add clones, the relative order of other candidates should not change.

Impossibility Theorem

No neutral axis scoring rule satisfies clone proximity, independence of clones and consistency with linearity.

	VD	MF	BC	MS	FT
